/clone lib="potato abiotic stress cDNA library"
/note="Vector: pCMVSport6.1; Site 1: EcoRI; Site_2: NotI;
supplier: Solanum tuberosum var. Kennebec plants were
grown from cuttings on a 16hr light/8 hr dark cycle at 25
C for 3-4 weeks. Abiotic stress conditions were applied to
four separate sets of plants. Set 1 involved saturation of
the soil with 150 mM NaCl and tissues were harvested at
following application of the salt stress (leaves: 2hr,
6hr, 11hr, 1d, 2d, and 4d; roots:2hr, 6hr, 11hr, and 2d).
Set 2 were grown under the standard conditions and then
were water stressed by withdrawal of further watering
applications. Drought stressed plants were harvested after
cessation of watering (leaves: 3d, 5d, and 7d; roots:3d
and 5d). Set 3 were grown under the standard conditions
and then were cold stressed by placement at 4 C. Cold
stressed leaves were harvested at 2 hr, 6 hr, 12 hr, 1 d,
2d. Set 4 were grown under the standard conditions and
then were harvested at 2 hr, 6 hr, 12 hr, 1 d,
2d. Set 4 were grown under the standard conditions and
then were harvested at 2 hr, 6 hr, 12 hr, 1 d,
2d and 4d and heat-stressed by placement at 35 C. Heat
stressed leaves were harvested at 2 hr, 6 hr, 12 hr, 1 d,
2d and 4d and heat-stressed roots were harvested at 6 hr,
12 hr, 1 d, and 4d, RNA was isolated from all tissues and
equal RNA from each tissue and stress was pooled to
construct the cDNA library. RNA sample."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /tissue_type="abiotic stress treated leaf and root tissue"

/R2, F3, and F4 lines of Aquilegia Formosa X A. pubescens
were grown from seed in greenhouses at UC Santa Barbara.
From these plants three sets of tissue were collected: 1)

Small flower buds (<10 mm) and very young inflorescences
(71 & 29% by weight respectively), 2) Medium (7-20 mm) and
large (at or near anthesis) flower buds (65 & 35% by
weight respectively) and 3) Shoot apical meristems. A
fourth set of tissue was collected from plants of A.
formosa. These plants were grown from seed in sand and at
approximately 1 month root tissue and leaf tissue of
various developmental stages were collected from each
set of tissue and pooled in the following proportions:
1.5x from sets 1 & 2, 1x from sets 3 & 4. From the pooled
total RNA, mRNA was extracted and enriched for full-length
messages and then normalized with proprietary methods by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /mol_type="mRNA"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              four separate sets of plants. Set I involved saturation of the soil with 150 mm NaCl and tissues were harvested at following application of the salt stress (leaves: 2hr, 6hr, 12hr, 1d, 2d, and 4d; roots:2hr, 6hr, 12hr, and 2d). Set 2 were grown under the standard conditions and then were water stressed by withdrawal of further watering applications. Drought stressed plants were harvested after cessation of watering (leaves: 3d, 5d, and 7d; roots:3d and 5d). Set 3 were grown under the standard conditions and then were cold stressed by placement at 4 C. Cold stressed leaves were harvested at 2 hr, 6 hr, 12 hr, 1 d, and 4d and roots were harvested at 2 hr, 6 hr, 12 hr, 1 d, and 4d and heat stressed by placement at 35 C. Heat stressed leaves were harvested at 2 hr, 6 hr, 12 hr, 1 d, and 4d and heat-stressed roots were harvested at 2 hr, 6 hr, 12 hr, 1 d, 2d and 4d and heat-stressed roots were harvested at 2 hr, 6 hr, 12 hr, 1 d, 2d and 4d and 4d. NM was isolated from all tissues and equal RNA from each tissue and stress was pooled to construct the cDNA library. RNA sample."

/note="Organ: Zygotic Embryos; Vector: pGADD7-ReCAB;
Site 1: EcoRI; Site 2: ClaI; Library enriched in
transcripts present in suspension culture of Loblolly pine
(Pinus taeda L.), 7-56. Suspension culture of Loblolly pine
form ferrilized megagametophytes, according to method of
pullman et al 2003 (Pullman, G., S. Johnson, G. Peter, J.
Cairney, and N. Xu. 2003. Improving loblolly pine somatic
embryo morphology, germination, and gene expression. Plant
Cell Reports 21:74-758.) This suspension cell culture,
which contains early developing embryos and
undifferentiated embryogeneic tissue, was the source of
the RNA used for the suspension culture library.
Subtracted from this was cDNA made from a pool of RNA from
zygotic embryos and female gametophytes from all stages of
development plus somatic embryos from developmental stages
beyond susepension culture (see Clavatta VT, Morillon R,
pullman GS, Chrispeels M, Cairney J. 2001. An
aquaglyceroporin is abundantly expressed early in the
development of the suspensor and the embryo proper of
loblolly pine (pinus taeda L.). Plant physiol. 127:

Fruit was collected on October 22, 2003, between 8 to 9 am and stored at 4C. The flavedo tissue was dissected out of developing fruit (165 DAFB) and used to isolate RNA using Trizol reagent from Invitrogen. The cDNA Library was constructed using the SMART cDNA library Kit (Clontech). The primary library was en masse evicted and plasmid DNA containing the cDNA library was isolated from the resultant bacterial population. Plasmid DNA was then transformed into ultra competent E coli cells (XLIO Gold; Stratagene). Transformants were plated out on Q-trays (2000 Cfu/tray), picked using a Qbot and archived in 384 well discharge the collection of the collectio

/note="vector: pCMV SPORT6.1; Site 1: EcoRI; Site 2: NotI;

F2, F3, and F4 lines of Aquilegia Formosa X A. pubescens
were grown from seed in greenhouses at UC Santa Barbara.
From these plants three sets of tissue were collected: 1)

Small flower buds (<10 mm) and very young inflorescences

(71 & 29% by weight respectively), 2) Medium (7-20 mm) and

large (at or near anthesis) flower buds (65 & 35% by
weight respectively) and 3) Shoot apical meristems. A

fourth set of tissue was collected from plants of A.

formosa. These plants were grown from seed in sand and at
approximately 1 month root tissue and leaf tissue of
various developmental stages were collected (84 % 16% by
weight respectively). Total RNA was extracted from each
set of tissue and pooled in the following proportions:
1.5X from sets 1 & 2, 1X from sets 3 & 4. From the pooled
total RNA, mRNA was extracted and enriched for full-length

2d. Set 4 were grown under the standard conditions and then were heat stressed by placement at 35 C. Heat stressed leaves were harvested at 2 hr, 6 hr, 12 hr, 12d and 4d and heat-stressed roots were harvested at 6 h 12 hr, 1 d, and 4d. RNA was isolated from all tissues a equal RNA from each tissue and stress was pooled to construct the cDNA library. RNA sample." hr,

An Arabidopsis full-length coNA library was constructed essentially
an Arabidopsis full-length coNA library was constructed essentially
as reported previously (Seki et al., 1998).cNNA cleaved with BamHI
and XhoI was ligated to modified Lambda FLC-1 vector (Carrinci et
al., submitted for publication) digested with BamHI and SalI. This
clone is in a modified psluescript vector. Please visit our web
site (http://www.gsc.riken.go.jp/e/plant/index _e.html) for further
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            details.
